Photo-active liquid crystalline materials: effect of lateral substitution far from the chiral center.

Wednesday, 6 September 2023 09:00 (20 minutes)

Photo-active liquid crystalline (LC) materials attract considerable attention as they give an exciting possibility to drive, tune and control the optical properties of soft systems in a contactless way. To contribute to better understanding of the effect of lateral substitution on the self-assembling behaviour, several new materials with lateral substituents are studied. These materials can be used as dopants for photo-active LC mixtures targeted for optoelectronic and photonic applications.

Tvorba meziatomárního potenciálu pro NiTi pomocí strojového učení

Wednesday, 6 September 2023 14:00 (20 minutes)

Simulace molekulární dynamiky jsou silně závislé na potenciálu, který určuje meziatomární interakce, volba tohoto potenciálu ovlivňuje kvalitu a spolehlivost získaných dat. Meziatomární potenciály jsou v současné době vytvářeny pomocí analytických funkcí, které mohou přinášet kvalitní výsledky u partikulárních problémů, nicméně v obecných problémech často selhávají. Neuroné sítě nám nabízí možnost vytvořit potenciály zcela novým, více univerzální způsobem. V článku bude představen nově vytvořený potenciál pomocí metod strojového učení pro systém binární slitiny NiTi a jeho základní charakteristiky.

Temperature dependence of silicon vacancy centers photoluminescence in polycrystalline diamond

Thursday, 7 September 2023 09:20 (20 minutes)

The silicon vacancy (SiV) colour center in diamond is an optically active crystallographic point defect. Narrow band light emission of SiV centers makes them desirable in various fields such as quantum optics. In this work, we study SiV centers in polycrystalline diamond by using time-resolved low temperature photoluminescence (PL) spectroscopy. We investigate the spectral position, width and decay dynamics of the SiV zero phonon line in the temperature range 12-300 K.

Resonant ultrasound spectroscopy for characterization of lattice instability in shape memory alloys

Wednesday, 6 September 2023 14:20 (30 minutes)

The lecture will summarize the advantages of using resonant ultrasound spectroscopy for ferroelastic alloys. Three recently studied cases will be discussed: i) single crystals of ferromagnetic shape memory alloys in which the instability-induced softening couples with magnetoelasticity; ii) the effective response of fine regular laminates in tetragonal martensitic lattices; iii) modulated crystals with highly mobile interfaces that act as strongly-nonlinear mechanical oscillators.

Shape Memory Alloy Exhibiting the Reentrant Austenite Behavior

Wednesday, 6 September 2023 14:50 (30 minutes)

During conventional martensitic transformation (MT) in shape-memory alloys (SMA), the parent (P) phase is stable at high temperatures, and the martensite (M) phase is formed during cooling. Very recently new class of SMA were discovered showing reentrant martensitic transformation back to austenitic phase at low temperatures. The occurrence of these novel phenomena originates from the reversal of phase stability between P and M phases connected with change in magnetic structure. In this contribution we will discuss lattice and magnetic contribution to this entropy reversal effect based on experimental study of elastic and magnetic properties.

Testing of thermal barrier coatings using concentrated solar power

Wednesday, 6 September 2023 09:40 (20 minutes)

The multi-layered thermal barrier coatings (TBC) are commonly used in systems exposed to extensive heat, such as jet engines. In service, the top-coat layer may be exposed to so-called CMAS particles. In the hot environment, the CMAS particles melt and penetrate the coating microstructure, inducing crystallographic and volumetric changes therein. In this proceeding, the possibilities of using concentrated solar power to test the performance of TBCs with and without CMAS will be discussed.

power output optimization from complex laser systems: solution for Yb:YAG laser rod in crystallographic orientation [111]

Wednesday, 6 September 2023 09:20 (20 minutes)

A novel approach to optimize power output from a complex laser system is presented. The proposed method employs the formalism of second-order coherence theory and is applied to power characterization. It addresses the optimization of power output for non-uniformly and completely polarized beams by selecting suitable input and output ideal elliptical polarizers. The method is demonstrated using the Yb:YAG laser rod cubic crystal with the crystallographic orientation [111].

Preparation and analysis of High Entropy Alloys thin films deposited by Ionized Jet Deposition method

Monday, 4 September 2023 16:30 (20 minutes)

The aim of my work was to investigate the preparation of high-entropy alloys thin films using the Ionized Jet Deposition method. In the theoretical part, high-entropy alloys are described, the IJD method is introduced and other analytical methods used in the thesis are briefly explained. In the experimental part of the thesis the preparation of the target for deposition of FeNiCoCuCr alloy by IJD method is described. A total of six layers were subsequently deposited from this target, two of which were test layers and the subsequent four were aimed at studying the effect of the deposition voltage. This series of four samples was analysed by AFM, SEM, EDS and XRD to determine the layer thickness, surface homogeneity, elemental and phase composition and their dependence on the deposition voltage. The analyses showed decreasing layer thickness, slightly decreasing homogeneity and approximately constant elemental composition with increasing deposition voltage and FCC content of phases with a small proportion of oxides. At the same time, the oxygen content was detected both in the layers and target. Future research should focus on increasing the homogeneity of the layers and modifying their elemental composition, especially the removal of oxygen.

Translokační defekty krystalové mříže

Thursday, 7 September 2023 09:00 (20 minutes)

Translokační defekty krystalové mříže nazýváme takové defekty, kdy se jednotlivé části krystalu skládají z několika identických mříží, které jsou vzájemně posunuté. Tento jev lze pozorovat na difrakčních snímcích, Pattersonově funkci a mnohdy také na zhoršené kvalitě map elektronové hustoty. Experimentální hodnoty lze však oproti tomuto jevu korigovat.

V makromolekulární krystalografii jsou tyto defekty velmi vzácné, přesto jejich řešení podstatnou součástí dalšího vývoje softwarových nástrojů.

Apparent anisotropic thermal diffusivity measured in cubic single crystals by transient grating spectroscopy

Wednesday, 6 September 2023 10:20 (20 minutes)

Transient grating spectroscopy (TGS) was used to measure the elastic and thermal properties of solid materials. Our measurements on cubic single crystals show anisotropic thermal diffusivity, which should be isotropic!

A finite element method (FEM) model was created to simulate the TGS measurements. The simulation with isotropic thermal diffusivity and elastic anisotropy leads to an apparent anisotropy of thermal diffusivity, which agrees with the measurements.

Preferred orientation of the shells of the species *Pseudanodonta complanata*, *Unio tumidus*, *Unio crassus* and *Anodonta anatina* determined using X-ray and neutron diffraction

Wednesday, 6 September 2023 16:00 (20 minutes)

The research investigates the crystalline structures of the shells from four distinct species. By employing advanced X-ray and neutron diffraction techniques, the study delves into the preferred orientation of these shells, shedding light on their internal composition and arrangement. The findings are anticipated to contribute to our understanding of the species' adaptations and ecological roles, while also providing insights into the broader field of biomaterial characterization. This research offers valuable implications for material science and evolutionary biology, emphasizing the significance of non-destructive analytical methods in studying biological structures.

Electronic structures of quasiparticle self-consistent *GW* (QSGW) in ferromagnetic Heusler alloys Ni_2MnX (Al, Ga, In)

Tuesday, 5 September 2023 11:20 (20 minutes)

The quasiparticle self-consistent *GW* method is an advanced *ab-initio* method for electronic structure calculations. A short explanation and a basic understanding of this method will be presented, with an example of an application and comparison with DFT calculations for Heusler alloys Ni_2MnX (Al, Ga, In). One of the electronic structure properties calculated is generalized susceptibility, which provides insight into possible intrinsic system instability.

Residual Stress Analysis of Additively Manufactured AlSi10Mg Alloy

Tuesday, 5 September 2023 11:40 (20 minutes)

Additive Manufacturing, precisely Selective Laser Melting (SLM) technology, is a promising metal powder consolidation method and offers outstanding parts production opportunities. It is based on selectively melting parts of a thin flat powder bed in layers using a scanning energy source to produce 3D parts. The intricacy of the SLM process results in the magnitude and orientation of residual stresses (RS) being highly dependent on laser power, scanning speed, scanning strategy, and other processing parameters. A correlation was observed between the RS and the formation of surface fatigue cracks for welded materials.

Applications of High Entropy Alloys

Wednesday, 6 September 2023 11:00 (30 minutes)

As High entropy alloys (HEAs) are usually called equimolar metallic alloys composed of five or more elements, typically of similar atomic radius, forming a randomly distributed tough solution crystallizing in face centered cubic (FCC) or body centered cubic (BCC) crystalline lattice. Energetically, from the point of its Gibbs free energy of mixing, the solution is stabilized by the entropic contribution, dominating over the enthalpy term. Due to its distorted structure, properties of HEAs differ in many aspects from traditional alloys. The contribution is focused on the already advanced/elaborated practical applications of HEAs which have appeared nowadays and can be considered as the most promising ones.

Elastic anisotropy of strongly textured pure Ti determined by resonant ultrasound spectroscopy

Wednesday, 6 September 2023 10:00 (20 minutes)

Resonant ultrasound spectroscopy (RUS) was employed to determine the elastic properties of commercially pure Ti grade 2 that was processed by room-temperature equal channel angular pressing (ECAP). The accumulated severe plastic deformation during the ECAP processing lead to an ultra-fined grained material with a strong texture, which persisted even after annealing at various temperatures. The elastic properties of the as-processed Ti and three annealed samples were studied by laser-based RUS, where the full set of elastic coefficients was determined from resonant spectra of millimeter-sized samples. All the annealed samples were found to be strongly anisotropic in the elastic properties, where the maxima of Young's modulus align with the directions of the (0001) texture maxima. Moreover, the evolution of shear modulus and internal friction was measured across a temperature cycle from room temperature up to 590 °C, providing valuable insights into the internal dynamics of the ECAP-processed Ti during annealing.

Optimal Substrate Temperature for Thin Film Deposition of High-temperature Superconductors Based on YBaCuO Using Ionized Jet Deposition

Monday, 4 September 2023 16:10 (20 minutes)

This research paper is focused on the dependence of phase composition according to the substrate temperature during the IJD deposition. Samples prepared with different substrate temperatures were analyzed using X-Ray spectroscopy and Atomic Force Microscopy in order to determine the chemical composition and presence of superconducting phase as well as thickness of the layer, which ranged between 500 and 1000 nm. In two of the samples superconducting phase was found.

Anomalous transport and Berry curvature in Fe₃Ga

Tuesday, 5 September 2023 09:50 (30 minutes)

The anomalous Nernst effect (ANE) is a member of the extensive family of topological effects in solid state physics. It converts a heat current into electric voltage and originates from the Berry curvature of electronic bands near the Fermi level. Recent results established the Fe₃Ga alloy as one of the most promising candidates for applications, due to its flat band structure consisting of a rich web of nodal lines. In this theoretical work, we study the effect of deformation of Fe₃Ga on the anomalous Nernst effect, which naturally occurs in thin films. Furthermore, we demonstrate that doping, which effectively shifts the position of the Fermi level, can also significantly modify the strength of the effect. Lastly, we provide detailed analysis of the origin of ANE in the electronic structure of Fe₃Ga which yields a deeper insight into the generating mechanisms, the understanding of which can lead to substantial enhancement of the effect in the future.

Rentgenová difrakce na Katedře inženýrství pevných látek

Tuesday, 5 September 2023 12:00 (20 minutes)

Laboratoř strukturní rentgenografie od loňského prosince využívá nový práškový rentgenový difraktometr Empyrean od firmy PANalytical, který významně rozšířil možnosti a kapacitu pracoviště. Tématika problémů řešených v Laboratoři strukturní rentgenografie jak v rámci projektů základního a aplikovaného výzkumu, tak i na žádost našich i zahraničních pracovišť a smluvních partnerů je neobyčejně pestrá. Za projekty základního výzkumu lze například zmínit projekt „Mechanické vlastnosti funkčních vrstev submikronových tloušťek“, v rámci aplikovaného výzkumu v současnosti běží projekt „Vysoce produktivní stroje pro prostředí digitálních továren“. Laboratoř spolupracuje s dalšími výzkumnými organizacemi a také se podílí na výzkumu průmyslových partnerů jak těch velkých jako například UJV Řež, a.s. nebo UJP Praha a.s., tak těch menších, avšak neméně důležitých, jako třeba NEVA – TST s.r.o., což je malý podnik v jižních Čechách zaměřující se na výrobu strojů a nástrojů pro zpracování dřeva. V rámci přednášky posluchače seznámím jak s výše zmíněným přístrojovým vybavením, tak také s aktuálně řešenými problémy a zajímavými výsledky.
